

# Modernizing Data warehousing solution on Cloud

## Business Challenge:

- Client is a leading international mining company with operations worldwide.
- Existing old data warehouse application that was sitting on Teradata appliance was not proving cost effective for the huge amount of IOT data generated from the trucks deployed for their truck business.
- Also the stream data from IOT was moved to the warehouse through batch process limiting the possibility of any real time analytics.

## Solution:

- Hexaware moved Teradata Data warehouse to Snowflake DWH
- Our solution introduced Streaming data analytics using Azure Databricks
- Data from IOT devices were routed to Databricks via event hub for real time analytics, can also be stored in Azure Blob storage before moving to Snowflake DWH for historic reporting

**Snowflake DWH provides capacity expansion at a lower cost solving their data growth issues**

**Databricks solution provided real time analytics capabilities to make informed decisions**
