

Domain Term of the Week

Episode 3 : Fleet Management System

A Fleet Management System in mining is a centralized platform used to monitor, control, and optimize the movement and performance of haul trucks, excavators, and other heavy equipment using real-time data, GPS, and telemetry systems.

Activities involved in the term

Equipment Tracking

Real-time location tracking using GPS systems

Dispatch Management

Assigning trucks and equipment for optimal routing

Load & Haul Optimization

Managing material movement from mine to processing units

Fuel & Utilization Monitoring

Tracking fuel usage and equipment efficiency

Maintenance Coordination

Integrating with maintenance systems for scheduling

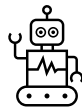

Support Activities

Real-time monitoring: Real-time dashboards and alerts

System Integration: Integration with telemetry systems

Process Automation: Data collection from onboard sensors

Reporting and performance analytics

Benefits to the Organization

Improved fleet utilization

Reduced idle time and fuel consumption

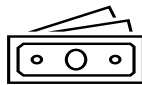

Increased production efficiency

Better operational visibility

Enhanced safety through monitoring

Reduced operational costs
